Draft February 20, 2024

1 Data Rate Problem

It is desired to send a sequence of computer screen images over optical fiber. The screen is 3840 $\times$ 2160 pixels, each pixel being 24 bits. There are 60 screen images per second. What data rate is needed?

$$\text{Data Rate} = \frac{\text{Number of bits}}{\text{Bits per second}}$$

There are 24 bits $\cdot (3840 \times 2160) =$ 199,065,600 bits per image. Transmitting 60 images per second gives a data rate of data rate is 60$\cdot$ 199,065,600 $= \underline{1.194 \cdot 10^{10} \text{ bits per second.}}$

2 FDM Multiplexing Problem

Ten signals, each requiring 4000 Hz, are multiplexed onto a single channel using FDM. What is the minimum bandwidth required for the multiplexed channel? Assume that the guard bands are 400 Hz wide.

$$\text{Bandwidth} = [\#\text{ of channels} \cdot \text{channel bandwidth}] + [(\#\text{ of channels} - 1) \cdot \text{guard band width}]$$

$$\text{Bandwidth} = [10 \cdot 4000Hz] + [(9) \cdot 400]$$
