Draft February 20, 2024

1 Data Rate Problem

It is desired to send a sequence of computer screen images over optical fiber. The screen is 3840×2160 pixels, each pixel being 24 bits. There are 60 screen images per second. What data rate is needed?

$$\text{Data Rate} = \frac{\text{Number of bits}}{\text{Bits per second}}$$

There are $24 \text{ bits} \cdot (3840 \times 2160) = 199,065,600$ bits per image. Transmitting 60 images per second gives a data rate of data rate is $60 \cdot 199,065,600 = 1.194 \cdot 10^{10}$ bits per second.

2 FDM Multiplexing Problem
