## 1 Data rate problem

It is desired to send a sequence of computer screen images over optical fiber. The screen is  $3840 \times 2160$  pixels, each pixel being 24 bits. There are 60 screen images per second. What data rate is needed?

 $Data\ Rate = \frac{Number\ of\ bits}{Bits\ per\ second}$ 

To find the bits per second quantity, we must first calculate the number of bits in a screen image. In this case, there are 24 bits  $\cdot$  (3840  $\times$  2160) bits in an image.

Therefore, the data rate needed is  $(24bits) \cdot (3840 \times 2160 pixels)/$
