## **Assignment 2**

1.1 Use induction to prove  $F_i = \frac{\phi^i - \hat{\phi}^i}{\sqrt{5}}$ ; where  $F_i = F_{i-2} + F_{i-1}$ , and  $\phi$  is the golden ratio  $\frac{1+\sqrt{5}}{2}$ .

To prove by induction, write out the expressions  $f_n$  and  $f_{n+1}$  (note:  $f_{n+1}$  is the same as  $f_n$ , but with (n+1) substituted everywhere in place of n). Next, if applicable, re-write the expression  $f_{n+1}$  in terms of  $f_n$  then perform algebraic manipulations on the expression until you reach some variation of  $f_{n+1} = f_{n+1}$ . Lastly, show that the expression  $f_c$  also holds for some constant c. The algebra is called "the inductive step", and the calculation for on the constant is called "the base case".

In this problem, the expression to prove is  $F_i=\frac{\phi^i-\hat{\phi}^i}{\sqrt{5}}$ , where  $\phi=\frac{1+\sqrt{5}}{\sqrt{5}}$ . Start by demonstrating the expression holds for constants c=0, c=1 (e.g., the "base case").

$$F_0 = \frac{\phi^0 - \hat{\phi}^0}{\sqrt{5}} \frac{1 - 1}{\sqrt{5}} \tag{1.1}$$

$$=0 (1.2)$$
